File-based encryption is a great way to keep files that contain sensitive data safe from being read or accessed by unauthorized users. WinSCP is a cross-platform FTP program that supports secure file transfers by encrypting and decrypting files and folders with a set of special commands. File-based encryption can be used to encrypt data in a standard file on your computer hard drive that's permanently available for access to the authorized people. To make sure that there is no loss of valuable information, you can attach a password to the file and make it unavailable to people who don't have the password or may not know it. Benefits of File-based encryption Files can be encrypted with a strong password, which means that the data in the file can't be read or accessed without it. Secure connections between computers are not necessary. Files are automatically encrypted after transferring them between two computers. It's very simple to work with file-based encryption, especially if you know the basics of such a technique. Simple installation Windows WinSCP is available as a free download. This product installs without additional software requirements, so the user doesn't have to concern himself with the installation of additional software like .NET or Visual C++. What's more, the application can be integrated into the system autostart lineup, in order to run by default every time you turn on your computer and encrypt the files in question. Platforms WinSCP supports multiple operating systems including Microsoft Windows. The application is compatible with Windows 2000, XP, Vista, Windows 7, Windows 8 and later. The development team also provides a portable version of the software, which means that users don't have to install a separate application to use it on their mobile devices. Interface With the help of this easy-to-use FTP application, you can encrypt files, folders, email messages, etc. by using special commands, which include the following: - add - adds files or directories to the encrypted list - copy - copies files or directories from one file system to another - copy - copies files or directories from an FTP server to another FTP server - delete - removes a file from the encrypted list - delete - removes a directory from the encrypted list - delete - removes files or directories from a server - get - downloads files from the server - get - downloads files from an FTP server - move - moves a file or directory to another directory or directory - move - moves files or directories to another

Scramble your files with this utility. NCF Utility is a powerful and easy-to-use security tool that can prevent users from acquiring important information when copying files. It doesn't actually block file transfers but scrambles the content of the copied files, making them unusable. The original items are left untouched. Simple setup and interface Setting up this tool takes minimal time and effort, since there are no special options, third-party offers, or mandatory software products bundled with the installation kit. As for the interface, NCF Utility opts for a standard window with a clear-cut structure, enabling you to populate the task list with the files you want to protect from copy operations. These can be dragged and dropped into the main frame while navigating disk directories in Windows Explorer. Protect contents from users who copy files You can check out the full path, size (bytes) and MD5 checksum of each file added to the list, find out the number of total items in the status bar, as well as initialize the guard with the click of a button. Before doing so, it's necessary to save all modifications. Moreover, the application can be integrated into the system autostart lineup, in order to run by default every time you turn on your computer and protect the files in question. Worth noting is that new files cannot be added to the list after starting the monitor and until you temporarily disable protection. It's also possible to include subfolders in the job list, as well as to export the list to file (.lpf) and later import it to pick up from where you left off, without having to recreate the same settings for file protection. This also means that you can create different lists with files to guard.
