Just think of it as a stripped down version of the Microsoft Windows Installer. Using Little Install Builder is very easy. You can quickly and easily create a setup package. It's main feature is the ability to automatically generate a compressed installer that contains a pre-configured path of files needed to install the application. After you have created the setup package with the correct files it is compressed using special software. If you go on a machine that has no program installed that needs to be installed, this will allow you to create a single install package containing all the files needed to install your program. I tested this on a Windows XP SP2 machine, it worked well and was easy to create the package. If you have your own installer and you need to have a source file for your target machine, you can take the zip file created and use it in your own installer. Here is a list of features available with Little Install Builder

- No Install.exe file
- Create one single installer package for your application that includes all the files required to install your application.
- Create the installer with the help of a Wizard
- A wizard guides the user through the installation process.
- Simple interface
- Very easy to use, and the window sizes are very manageable.
- Create Setup Files for all types of systems
- Be it Windows, Linux, Mac, etc.. the program can create a setup file for all the operating systems.
- Can be used on the go
- Ironically enough, this application does not require installation, which means it's good to go from the moment the download is finished.
- As such, you can take it anywhere you go on a USB Flash drive, 77a5ca646e

Little Install Builder is a compact application for creating installers for your application packages, making your files easy to deliver. No support for folder structures Somewhere along the way you need to add the files that need to be delivered to the end user.

Although this step is easy, odd implementation of features makes it rather impractical. First of all, you can't drag files and folders over the main window. Using the built-in open dialog is also frustrating, because selecting too many files doesn't add them, while folder selection is impossible, as is creating directories in the application's file manager. Poor set of features This has a direct impact on the shortcut selection tab, because it's used to select from imported files. If successful, it also lets you add special parameters. The last step is to specify output settings. These only count as a few, with requirement fields for destination and name. A "Test Run" button attempts to check the installer, but no feedback is delivered whatsoever. What's more, there's a high chance the building process is subject to failure, especially if there's one missing file or one the application can't process. If you do manage to get ahold of the output file, it's pretty shallow, with no customizable visuals, while programs you pack inside need to be simple, due to the lack of a registry editor and other advanced settings. In conclusion Bottom line is that every self-respecting program needs to be delivered in at least a basic setup package, but Little Install Builder isn't quite the tool for the task. Sure, it's easy enough to use, with a simple interface that makes sure you don't get stuck along the way. However, starting with poor file import methods and ending with the faulty building process, you're better off creating your own installer with all that programming skill. Little Install Builder Screenshot: Little Install Builder Screenshot: Little Install Builder Publisher Description: The number of things which are included in a typical app package is usually quite high. First of all there's the application itself, all the files that need to be installed with the application, an icon, an application shortcut, a setup program and if not everything is required for the setup program, also a post-install uninstaller. An additional impact on the size of such a package is the user interface that has to be provided. That's why we've created Little Install Builder. This small tool helps you to create installation packages for your applications

application to do the trick. Unlike the standard print service, which is printer-specific, this application supports all printers in the local network. The application was created in such a way that you can search for your printer from the network and get it directly installed on your computer. However, if you want to use this application with multiple printers on a network you can save the settings and access them later. Unlike many other services, this one allows you to use your own printer drivers without the additional costs. So, you can enjoy the application without worrying about over-spending. Once your printer is installed, the application can manage all of its settings including the following: Send your print jobs directly to the printer and specify the type of paper you want to print on. Print the print jobs on a specified paper type, in various sizes. The application can be used without displaying print queues on the desktop. Because there are no additional files for the printer, it won't increase the size of your printer. The advantages of this application are quite obvious. Try before you buy: The product page includes a video that will show you how the application works. Welcome to the Game Item Database or GID for short.
