Both caloric intake and energy expenditure are key determinants of gut microbiota composition, host metabolism and health. Fasting and food restriction are physiological, and have distinct effects on host metabolism, physiology and behaviour, though the interplay between these physiological processes is largely unknown. Here, we

provide a critical review of the effects of fasting and food restriction on the gut microbiota, metabolism and host health in mice, rats, cows and humans, and discuss the implications of our findings for the role of food restriction in promoting gut microbial diversity, activity and resilience to perturbations in gut health. Fasting and food restriction modulate the composition, activity and functional potential of the gut microbiota, and may contribute to gut microbial diversity and resilience to perturbations in gut health. Fasting and food restriction-induced changes in the gut microbiota may be transient and dynamic, and can influence host metabolism and health. The influence of food restriction on the gut microbiota and host health may differ
